

Cooking Smallmouth Bass

Micropterus dolomieu · kitchen guide

From legal fish to boneless meal

START WITH A LAWFUL, COLD FISH

Confirm the live Wisconsin DNR rule and consumption advisory for the exact water, species, length, and date. Kill a retained fish promptly; do not let it suffocate slowly. Bleed only where lawful and practical, then place it in a draining ice slurry or on ice. Keep raw fish at or below 40 °F; wash hands, knife, and board after contact with viscera.

Keep or release?

Legal floor	May 2, 2026–Mar 7, 2027; 14-in minimum; bass daily bag 5 combined on both lakes.
Preferred table fish	A legal lower- to mid-size fish; release large adults.
Why	Mid-size portions are even and large bass are valuable spawners; predators accumulate mercury.
Legal is not the same as desirable. A fish may be lawful yet a poor choice because it is a large breeder, exceeds current meal advice, or cannot be chilled and used promptly.	

Dispatch and field care

1. Use a decisive percussive blow to the skull immediately above and just behind the eyes. Follow with a spike or narrow knife into the brain cavity.
2. Confirm loss of rhythmic gill movement and eye reflex. If either remains, repeat immediately. Cut the gill arches only after insensibility.
3. Keep the fish shaded, clean, and cold. Do not soak flesh in warm lake water. At home, work in small batches and return finished portions to ice.

Clean without contaminating the flesh

1. **Set up.** Flexible sharp fillet knife, cut-resistant glove on the non-knife hand, scaler or spoon if needed, pliers, clean towels, two trays.
2. **Scale or skin.** For skinless fillets, leave scales on during cutting, then slide a shallow blade between skin and meat. Trim dark lateral tissue and belly fat.
3. **Open shallowly.** From vent toward the throat, lift the belly wall away from organs and use the tip only. Remove viscera intact. Avoid puncturing the gall bladder; trim and rinse any contaminated tissue.
4. **Kidney line.** Scrape the dark tissue along the backbone and rinse briefly with clean potable water. Pat dry. Never use soap on food.

Parasites and raw fish

Freezing and pickling are not substitutes for a validated parasite-control process. Cook wild freshwater fish to an internal temperature of 145 °F, or until opaque and separating easily, unless following a qualified food-safety process. Discard abnormal-smelling or badly diseased flesh; when uncertain, do not eat it.

Species-specific first cuts

Follow the collar around the shoulder, turn at the backbone, and run to tail. Lift and sweep over ribs rather than cutting through them; separate thick shoulder from tail.

Bone map and deboning

1. Keep the skin side down so the blade can ride on, not through, the bones.
2. Remove the rib cage with a shallow sweep, sacrificing as little belly meat as possible. Run fingertips both directions along every cut surface.
3. Brush the centerline both directions. Pull pins in the angle they enter or V-cut the front center; leave as much clean shoulder as possible.
4. Portion only after a final fingertip inspection under a bright light. Bones become harder to locate once batter, crumbs, or sauce is added.

Trim map

Remove rib membrane, belly fat, skin, and dark lateral meat. Trimming does not remove mercury from muscle.

Prepare before heat

- Pat portions dry. Equal thickness matters more than equal weight.
- Portion the shoulder and tail separately. Pat dry and season simply; do not soak at room temperature.
- Refrigerate while the pan, oven, or grill heats. Marinate under refrigeration; discard marinade that contacted raw fish unless boiled.

Two dependable methods

Herb skillet smallmouth
Sear dry portions, turn once, and baste briefly with herb butter; finish to 145 °F.
Foil-steamed bass
Seal portions with sliced vegetables and lemon, bake, then open carefully away from steam; verify 145 °F.

Current safe-eating advice · checked 2026-07-26

Statewide inland bass baseline: women under 50 and children under 15, up to one serving/month; women 50+ and men, up to one/week. Check lake and length.

THE QUERY BEATS THE PRINTED SHEET

Wisconsin has a statewide inland baseline and water-specific exceptions. Before eating, use DNR’s Fish Consumption Advisory Query for Pine Lake (WBIC 779200) or North Lake (WBIC 850800), and match species and length. People who are pregnant, may become pregnant, are breastfeeding, and children need the more protective category. When advice changes, follow the current query.
