

Cooking Cisco

From legal fish to boneless meal

Coregonus artedii · kitchen guide

START WITH A LAWFUL, COLD FISH

Confirm the live Wisconsin DNR rule and consumption advisory for the exact water, species, length, and date. Kill a retained fish promptly; do not let it suffocate slowly. Bleed only where lawful and practical, then place it in a draining ice slurry or on ice. Keep raw fish at or below 40 °F; wash hands, knife, and board after contact with viscera.

Keep or release?

Legal floor	Open all year; no minimum; cisco/whitefish daily bag 10 on both lake pages (2026–27). Confirm presence and rule.
Preferred table fish	Bright, firm, promptly iced adults; favor smaller fish that cook evenly.
Why	Cisco deteriorates quickly when warm; condition and cold chain matter more than trophy length.

Legal is not the same as desirable. A fish may be lawful yet a poor choice because it is a large breeder, exceeds current meal advice, or cannot be chilled and used promptly.

Dispatch and field care

1. Use a decisive percussive blow to the skull immediately above and just behind the eyes. Follow with a spike or narrow knife into the brain cavity.
2. Confirm loss of rhythmic gill movement and eye reflex. If either remains, repeat immediately. Cut the gill arches only after insensibility.
3. Keep the fish shaded, clean, and cold. Do not soak flesh in warm lake water. At home, work in small batches and return finished portions to ice.

Stabilize behind the head; lift the belly wall and keep the opening shallow.

1. **Set up.** Flexible sharp fillet knife, cut-resistant glove on the non-knife hand, scaler or spoon if needed, pliers, clean towels, two trays.
2. **Scale or skin.** Scales release easily: scrape gently tail-to-head if roasting skin-on. For fillets, skin after cutting; remove the dark lateral fat if taste or advisory calls for trimming.
3. **Open shallowly.** From vent toward the throat, lift the belly wall away from organs and use the tip only. Remove viscera intact. Avoid puncturing the gall bladder; trim and rinse any contaminated tissue.
4. **Kidney line.** Scrape the dark tissue along the backbone and rinse briefly with clean potable water. Pat dry. Never use soap on food.

Parasites and raw fish

Freezing and pickling are not substitutes for a validated parasite-control process. Cook wild freshwater fish to an internal temperature of 145 °F, or until opaque and separating easily, unless following a qualified food-safety process. Discard abnormal-smelling or badly diseased flesh; when uncertain, do not eat it.

Species-specific first cuts

Make a collar cut, follow the soft backbone toward the tail with a flexible blade, then lift the fillet over the fine ribs. Use light pressure so the thin flesh does not tear.

Collar cut to backbone; turn the edge flat and follow the frame toward the tail.

Bone map and deboning

Shallow rib fan at the shoulder; fine pin bones follow the thick centerline. Pull pins forward at their natural angle.

1. Keep the skin side down so the blade can ride on, not through, the bones.
2. Remove the rib cage with a shallow sweep, sacrificing as little belly meat as possible. Run fingertips both directions along every cut surface.
3. Chill first, then pull fine pins in their natural forward angle. A narrow center V is reliable for small fillets.
4. Portion only after a final fingertip inspection under a bright light. Bones become harder to locate once batter, crumbs, or sauce is added.

Trim map
Remove belly lining and kidney tissue. Oily flesh oxidizes: wrap air-tight and use or freeze promptly.

Prepare before heat

- Pat portions dry. Equal thickness matters more than equal weight.
- A short dry brine firms fragile flesh. Rinse only if the formula requires it, pat completely dry, and keep cold.
- Refrigerate while the pan, oven, or grill heats. Marinate under refrigeration; discard marinade that contacted raw fish unless boiled.

Two dependable methods

Hot-smoke fillets at left; broil a butterflied fish skin-side down at right. Verify the thickest flesh with a thermometer.

Hot-smoked cisco
Use a tested brine and hot-smoking process; smoke is flavor, not a safety shortcut. Bring the thickest flesh to 145 °F, cool promptly, refrigerate.
Broiled butterflied cisco
Open the cleaned fish along the backbone, season lightly, broil skin-side down until opaque and 145 °F; lift portions away from skeleton.

Current safe-eating advice · checked 2026-07-26

Cisco falls under “all other species” in the statewide inland baseline: under-50 women and children under 15, up to one serving/month; women 50+ and men, up to one/week. Check lake-specific advice.

1 serving

adult: about the palm of the hand
child: about the child’s palm

count all fish meals from all sources

THE QUERY BEATS THE PRINTED SHEET

Wisconsin has a statewide inland baseline and water-specific exceptions. Before eating, use DNR's Fish Consumption Advisory Query for Pine Lake (WBIC 779200) or North Lake (WBIC 850800), and match species and length. People who are pregnant, may become pregnant, are breastfeeding, and children need the more protective category. When advice changes, follow the current query.
