

START WITH A LAWFUL, COLD FISH

Confirm the live Wisconsin DNR rule and consumption advisory for the exact water, species, length, and date. Kill a retained fish promptly; do not let it suffocate slowly. Bleed only where lawful and practical, then place it in a draining ice slurry or on ice. Keep raw fish at or below 40 °F; wash hands, knife, and board after contact with viscera.

Keep or release?

Legal floor	May 2, 2026–Mar 7, 2027; 26-in minimum; daily bag 2 on both lakes.
Preferred table fish	A legal fish near the lower end of the available range; release large females.
Why	Mid-size flesh portions well; large predators are valuable breeders and generally accumulate more mercury.

Legal is not the same as desirable. A fish may be lawful yet a poor choice because it is a large breeder, exceeds current meal advice, or cannot be chilled and used promptly.

Dispatch and field care

1. Use a decisive percussive blow to the skull immediately above and just behind the eyes. Follow with a spike or narrow knife into the brain cavity.
2. Confirm loss of rhythmic gill movement and eye reflex. If either remains, repeat immediately. Cut the gill arches only after insensibility.
3. Keep the fish shaded, clean, and cold. Do not soak flesh in warm lake water. At home, work in small batches and return finished portions to ice.

Collar and shallow opening

Sweep ribs, blade nearly flat

1. **Set up.** Flexible sharp fillet knife, cut-resistant glove on the non-knife hand, scaler or spoon if needed, pliers, clean towels, two trays.
2. **Scale or skin.** Do not scale. Rinse slime cold, wipe the board, cut the fillets, then remove tough skin with a shallow blade held nearly flat.
3. **Open shallowly.** From vent toward the throat, lift the belly wall away from organs and use the tip only. Remove viscera intact. Avoid puncturing the gall bladder; trim and rinse any contaminated tissue.
4. **Kidney line.** Scrape the dark tissue along the backbone and rinse briefly with clean potable water. Pat dry. Never use soap on food.

Parasites and raw fish

Freezing and pickling are not substitutes for a validated parasite-control process. Cook wild freshwater fish to an internal temperature of 145 °F, or until opaque and separating easily, unless following a qualified food-safety process. Discard abnormal-smelling or badly diseased flesh; when uncertain, do not eat it.

Species-specific first cuts

Take both side filets without cutting through ribs, then sweep ribs away. Separate the boneless tail behind the dorsal-fin region before tracing the Y-bone row in the upper front loin.

Bone map and deboning

Cut above and below Y-bone row

Keep loins and boneless tail

1. Keep the skin side down so the blade can ride on, not through, the bones.
2. Remove the rib cage with a shallow sweep, sacrificing as little belly meat as possible. Run fingertips both directions along every cut surface.
3. Feel the Y tips. Slice lengthwise immediately above them, then below them, lifting two boneless loins and leaving a narrow bony strip. Do not expect pliers to pull the forked bones intact.
4. Portion only after a final fingertip inspection under a bright light. Bones become harder to locate once batter, crumbs, or sauce is added.

Trim map

Five-piece result: two upper loins, two lower loins, one tail section, plus discarded Y-bone strips. Remove skin, belly lining, and dark lateral tissue.

Prepare before heat

- Pat portions dry. Equal thickness matters more than equal weight.
- Keep the five pieces separate and match thickness. Brine lightly for frying or cut boneless loin into equal poaching portions.
- Refrigerate while the pan, oven, or grill heats. Marinate under refrigeration; discard marinade that contacted raw fish

unless boiled.

Two dependable methods

Crisp pike pieces

Shallow-fry; turn once

Poach below a boil; probe the thickest piece

Coat dry boneless pieces lightly and shallow-fry, turning once; check the thickest piece for 145 °F.

Gentle poached pike

Poach equal loin pieces below a boil in seasoned liquid until opaque and 145 °F; serve immediately or chill rapidly.

Current safe-eating advice · checked 2026-07-26

Statewide inland pike baseline: women under 50 and children under 15, up to one serving/month; women 50+ and men, up to one/week. Check water and length in the current query.

THE QUERY BEATS THE PRINTED SHEET

Wisconsin has a statewide inland baseline and water-specific exceptions. Before eating, use DNR’s Fish Consumption Advisory Query for Pine Lake (WBIC 779200) or North Lake (WBIC 850800), and match species and length. People who are pregnant, may become pregnant, are breastfeeding, and children need the more protective category. When advice changes, follow the current query.
